CURRENT READ-THROUGH

The macro backdrop is registering a **Goldilocks** regime (high confidence): growth is expanding and inflation remains contained — historically one of the most constructive environments for risk assets, with equities, credit, and cyclical sectors tending to outperform over 12-month investment horizons. The classification is primarily driven by: CPI at **3.35% YoY** (running at a moderate pace), unemployment at **4.1%** (improving), the 10Y-2Y yield spread at **0.32%** (positively sloped), VIX at **17.2** (subdued, consistent with low perceived risk). Notably, the regime has transitioned from **Overheating** in the prior month — a shift that historically marks an inflection point in cross-asset performance and warrants reassessment of positioning across asset classes. No major risk signals are currently triggered; the regime classification rests on trend inputs rather than acute stress readings, suggesting the environment lacks the tail-risk characteristics typical of market dislocations. Going forward, investors should closely monitor any re-acceleration in core services CPI that could prompt a more restrictive Fed stance, and early signs of labor-market softening — a sustained rise in initial claims or consecutive payroll misses would be the most credible leading indicator of a transition toward Recession Risk.

Playbook bias Risk-on. Overweight equities, underweight bonds. Carry strategies work well. Prefer cyclicals over defensives. Credit spreads typically tightening — HYG/LQD favorable.

CURRENT READ-THROUGH

The model assigns a **11.6% recession probability** — below the historical base rate of ~15%, consistent with ongoing expansion. The 2s10s yield curve is positively sloped at +32 bps, a neutral-to-supportive signal for near-term growth. The macro/market divergence indicator shows **Macro ahead of markets** (-32 pts) — one signal is leading the other.
